

NON-CUSTODIAL GROUP SETTLEMENT

SplitLane

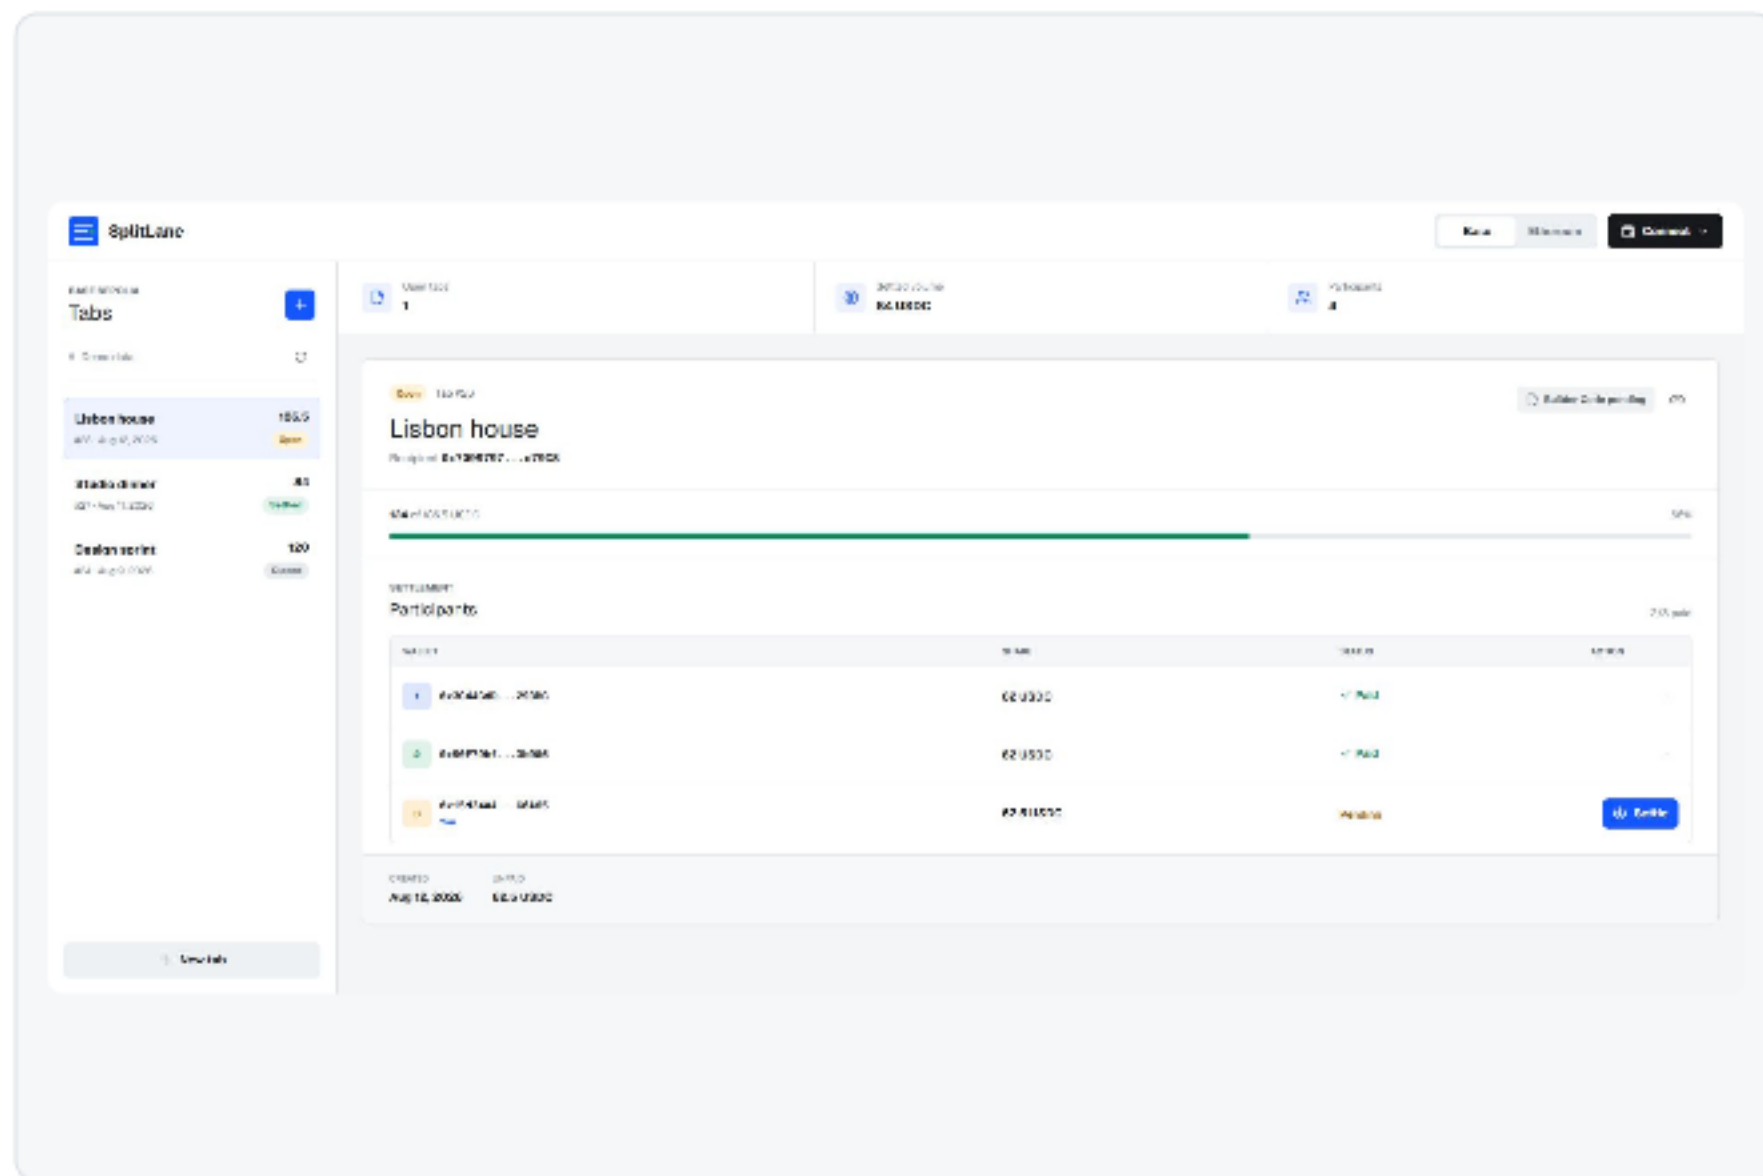

Exact USDC shares, paid directly to the recipient.

Base Sepolia + Ethereum Sepolia | Attestcoin proof lane on Creditcoin CC3

Group expenses need coordination, not custody

Shared bills create three recurring problems:

1. One person fronts the full amount.
2. Participants lose track of exact shares.
3. Pooled wallets add avoidable trust and withdrawal risk.

SplitLane records the obligation and lets every participant settle their own share.

A tab moves from agreement to direct settlement

CREATE

Recipient defines the tab

Title, metadata hash, participants and exact USDC shares are recorded onchain.

SETTLE

Each participant pays

USDC moves from that participant directly to the recipient after approval.

PROVE

Receipt evidence is verified

Ethereum Sepolia receipts can enter the Attestcoin proof lane on CC3.

Two chains share one narrow contract surface

Web dashboard

Next.js + wagmi/viem
Base Account wallet connection
Shareable chain-aware tab URLs

SplitLane contract

Immutable tab records
Exact participant shares
Direct USDC transferFrom settlement

Base Sepolia lane

Official Circle USDC
Builder Code attribution support
Base explorer transaction links

Ethereum Sepolia receipt inspection
Proof construction and verification
Creditcoin CC3 BlockProver

The security model removes pooled-fund failure modes

The contract records obligations. It does not become a bank account.

Payment remains participant-initiated. The contract has no owner, upgrade, admin withdrawal, recovery, or native-currency path.

- **No pooled custody**
- **No privileged withdrawal**
- **No recipient self-share**
- **Reentrancy protection**
- **Exact fixed shares**

Threat model and invariant tests are included in the repository.

Attestcoin is a deliberate Ethereum-only proof lane

Chain separation is enforced in code so the demo never overstates what is proven.

Ethereum Sepolia

Accepted source chain
Receipt inspected
Proof built
BlockProver verification supported

Base Sepolia

Settlement supported
Builder Code attribution supported
Attestcoin proof requests rejected

Proof evidence is emitted only after source transaction inspection and verification steps complete.

Built, tested, ready for public testnet evidence

13 web tests | 15 Attestcoin tests | 30 Foundry tests

Public repository, live URLs and deployment hashes are added after release.
